

AGENTLESS OS-LEVEL REMEDIATION

Proactively safeguard your systems directly at the OS-Level on the endpoint

Veriti's pioneering solution is the industry's first comprehensive Agentless OS-Level Remediation. No scanning, no added files, and definitely no server hassle. Reduce overhead, improve scalability, and enhance resiliency all without deployment or maintenance of an agent. We empower you to proactively safeguard your systems by nipping vulnerabilities in the bud, directly at the OS-level on the endpoint. Stop attacks before they even begin, fixing the root cause, and reduce the risk factor.

Enterprises have long suffered from tunnel vision, trapped within siloed security measures that only scratch the surface of protection. The result? Vulnerabilities lurking within your organization, both known and emerging, remain a constant threat.

But here's the game-changer: while traditional security solutions like email security, Firewalls, EDR, and EPP might miss the mark, Veriti steps in to seal the gaps. Picture this: attackers executing their exploits unnoticed. Imagine cutting out the middle-men (siloed security controls) to mitigate the risk at the OS level on the endpoint before it is exploited, without deploying any agent.. With Veriti, we don't just detect the threat; we safely perform real-time operating systems adjustments, and remediating vulnerable systems or applications in one click. With Veriti agentless remediation, there's no need to burden your systems with additional software when remediating vulnerabilities, addressing misconfigurations, or fortifying local security defenses.

66%

Of security leaders report a vulnerability backlog of over 100,000 vulnerabilities

30%

Of security leaders say they can't hire enough staff to handle the workload

54%

Of security leaders say they were only able to patch less than 50% of vulnerabilities in the backlog

THE POWER TO CHOOSE YOUR REMEDIATION

Veriti goes beyond mere convenience by giving you the power to choose your remediation. Unify the analysis, assessment, and remediation of threats across your organization, ensuring a consistent and coordinated response to security incidents. Security teams are enabled with the expertise they need to automatically rectify misconfigurations and shore up security gaps with a single click. Whether it's at the email security level, network security level, EDR security, or the OS-level on the endpoint, Veriti ensures swift and effective remediation, safeguarding your organization against emerging threats.

SOLUTION FEATURES

Continuous Monitoring and Insights

Agile Remediation

Security hardening best practices feed into actionable "Insights"

OS Fortification: Strengthening defenses to prevent future breaches

OS Protection beyond the perimeter extending to protect the remote workforce

Configuration vulnerabilities: Locate and resolve misconfigurations, enhancing endpoint and infrastructure security

Rogue Applications: Identify and block unvetted apps to stop malware infiltration

KEY BENEFITS

AGENTLESS OPERATING
SYSTEM REMEDIATION

SEAMLESS AND NON-
DISRUPTIVE REMEDIATION

COORDINATED RESPONSE
ACROSS TEAMS

AUTOMATED SECURITY CONTROLS OPTIMIZATION

Veriti automatically analyzes security configurations and correlates them with sensor telemetries, security logs, and threat intelligence feeds to provide contextual, actionable insights. Enterprises can remediate security gaps and misconfigurations proactively before they are exploited. Optimize security controls to address immediate risks without impacting business applications, and identify security controls impacting business applications helping security teams quickly analyze scope and remediation options.

Veriti's mission is to eliminate complexity and operational friction in managing multiple cybersecurity solutions by providing a consolidated, governing platform that proactively monitors and in a single click, remediates security gaps and misconfigurations across the entire security infrastructure.
